

Sales Analysis Dashboard

Executive Summary

Excel Sales Analytics Project

Power Query • Pivot Tables • Pivot Charts • Interactive Dashboard

This report summarizes the sales dashboard developed from product, customer, and order datasets. The analysis focuses on revenue, order activity, product performance, geographic demand, occasions, hourly sales patterns, and delivery time.

1. Executive Overview

The Sales Analysis Dashboard provides an interactive view of business performance using three source datasets: Products, Customers, and Orders. The datasets were imported into Excel through Get Data and prepared using Power Query before being analyzed with Pivot Tables and visualized through an interactive dashboard.

The dashboard consolidates key commercial and operational indicators into a single view, allowing users to explore performance by order date, delivery date, and occasion.

2. Key Performance Indicators

Total Orders	Total Revenue	Avg. Order-Delivery Time	Avg. Customer Spend
1,000	₹35,20,984	5.53	₹3,520.98

The dashboard reports 1,000 total orders and ₹35,20,984 in total revenue, equivalent to an average customer spend of approximately ₹3,520.98. The reported average order-delivery time is 5.53; the dashboard does not explicitly display the unit.

3. Key Findings

Revenue by Category

Colors is the strongest revenue-generating category at approximately ₹10 lakh. Soft Toys and Sweets are the next major contributors, while Mugs and Plants contribute less.

Top Cities by Orders

Imphal has the highest order count among the displayed top 10 cities, followed by Dhanbad and Kavali. This chart measures order volume rather than revenue.

Revenue by Month

Revenue varies substantially by month, with prominent peaks around February, August, and November. The pattern suggests possible seasonality, although the dashboard alone does not establish the cause.

Revenue by Occasion

Anniversary and Raksha Bandhan are among the strongest occasion-related revenue contributors, highlighting the importance of occasion-driven purchasing.

Revenue by Order Hour

Revenue is relatively strong during the evening, particularly around 18:00–20:00. This may help inform the timing of promotional activity and operational planning.

Top 5 Products by Revenue

Magnam Set leads the displayed top five products by revenue, followed by Quia Gift, Dolores Gift, Harum Pack, and Deserunt Box.

4. Business Implications & Recommendations

Prioritize high-performing categories

Investigate the drivers behind the strong revenue contribution of Colors, Soft Toys, and Sweets and consider whether successful products within these categories can be expanded.

Plan around high-performing occasions

Use historical occasion performance to support inventory, promotional, and campaign planning ahead of Anniversary and Raksha Bandhan and other important periods.

Investigate seasonal revenue peaks

Examine the February, August, and November spikes alongside occasion, product, and customer data to identify the factors behind the increased revenue.

Optimize evening activity

Because revenue is comparatively strong during evening hours, test targeted promotions or customer engagement during these periods.

Evaluate cities using revenue as well as orders

Order volume alone does not show commercial value. A useful next analysis would compare city revenue and average order value in addition to order count.

Monitor delivery performance

Track the average order-to-delivery measure over time and, where possible, break it down by city, product, and occasion to identify operational opportunities.

5. Project Methodology

Source Data	Preparation	Analysis	Reporting
Products Customers Orders	Get Data Power Query Cleaning & Transformation	Pivot Tables Pivot Charts	Interactive Dashboard Business Insights

6. Dashboard Interactivity

The dashboard includes filters for Order Date, Delivery Date, and Occasion. These controls allow users to move from an overall sales view to a more focused analysis of specific periods or occasions.

7. Conclusion

This project demonstrates how raw product, customer, and order data can be transformed into an interactive business dashboard using Microsoft Excel. Power Query was used for data preparation and transformation, while Pivot Tables and Pivot Charts supported the analysis and visualization. The resulting dashboard provides a practical view of sales performance and highlights differences across categories, products, cities, occasions, months, order hours, and delivery performance.

Note: Findings in this report are based on the information visible in the completed dashboard. Where the dashboard does not provide enough detail to establish a cause, the finding is presented as an area for further investigation rather than a confirmed conclusion.
